

Ein Multicast-Paket im Subnetz empfangen

```
public static String receiveServerAddress() {
    InetAddress address = null;
    try {
        MulticastSocket socket = new MulticastSocket(4447);
        DatagramPacket packet;
        // Auf Anfrage warten
        packet = new DatagramPacket(new byte[65536], 1024);
        socket.receive(packet);
        // Empfänger auslesen
        address = packet.getAddress();
        int port = packet.getPort();
        int len = packet.getLength();
        byte data[] = packet.getData();
        System.out.println("Anfrage von " + address + " vom Port "
            + port + " Laenge " + len + "\n"
            + new String(data, 0, len, "UTF8"));
    } catch (Exception e) {
        e.printStackTrace();
    }
    return address.getHostAddress();
}
```
